

# Class 5- Data Viz with ggplot

Joshua Khalil (PID:A17784122)

## Table of contents

Background . . . . .	1
Gene Expression Plot . . . . .	4
Going Further . . . . .	7
Custom Plot . . . . .	9

## Background

There are lots of ways to make figures in R. These include so called “base R” graphics (e.g. `plot()`) and tons of add on packages like `ggplot2`.

For example here, we make the same plot with both:

```
head(cars)
```

```
  speed dist
1      4    2
2      4   10
3      7    4
4      7   22
5      8   16
6      9   10
```

```
plot(cars)
```

First I need to install the package with the command `install.packages()`

**N.B** We never run an install cmd in quarto code chunk or we will end up re-installing packages many times which is not what we want!

Everytime we want to use one of these “add-on” packages we need to load it up in R with the `library()` function:

```
library(ggplot2)
```

```
ggplot(cars)
```

Every ggplot needs at least three things:

- The **data**, the information you want plotted
- The **aesthetics**, how the data map to the plot
- The **geometry**, the type of plot

```
p <- ggplot(cars) +  
  aes(x=speed, y=dist) +  
  geom_point() +  
  geom_smooth(method="lm", se= FALSE) +  
  labs(title="Stopping distance of old cars",  
       subtitle = "Data from the `cars` object",  
       x= "Speed (mph)",  
       y= "Distance (ft)")
```

Add a line to better show relationship

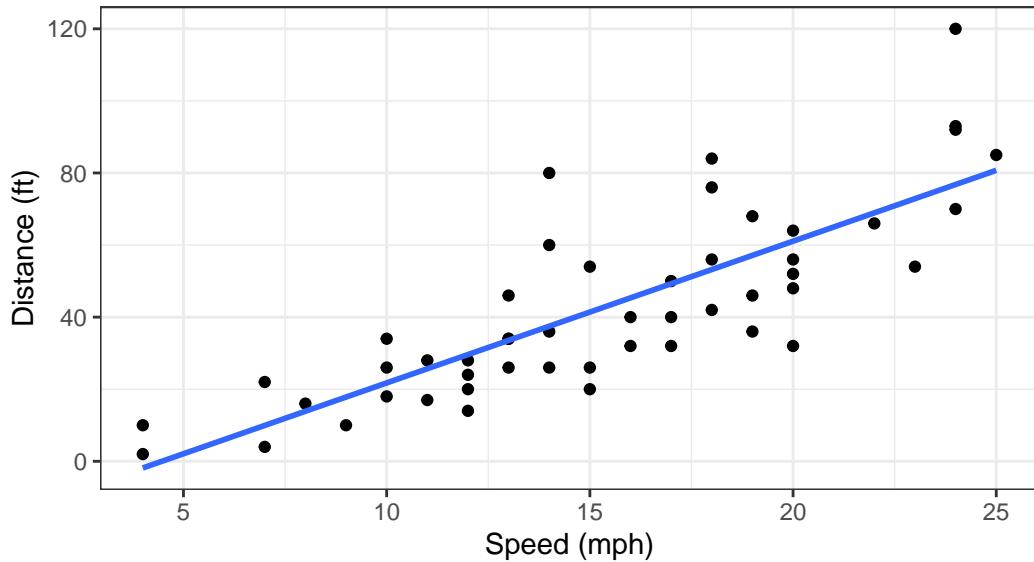

Render it out

```
p + theme_bw()
```

```
`geom_smooth()` using formula = 'y ~ x'
```

## Stopping distance of old cars

Data from the 'cars' object

## Gene Expression Plot

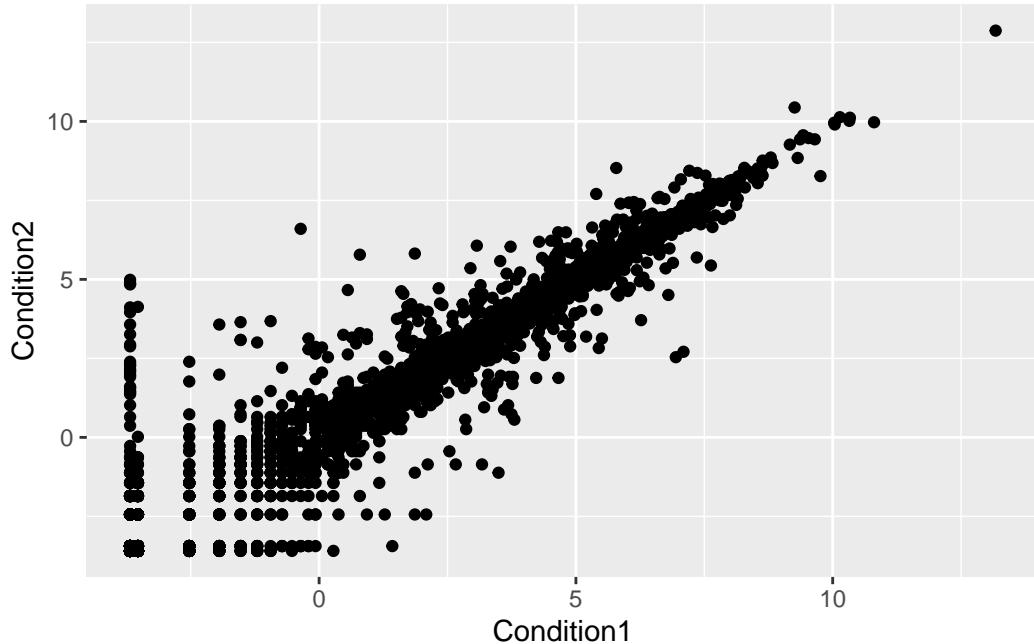

We can read the input data from the class website

```
url <- "https://bioboot.github.io/bimm143_S20/class-material/up_down_expression.txt"
genes <- read.delim(url)
head(genes)
```

	Gene	Condition1	Condition2	State
1	A4GNT	-3.6808610	-3.4401355	unchanging
2	AAAS	4.5479580	4.3864126	unchanging
3	AASDH	3.7190695	3.4787276	unchanging
4	AATF	5.0784720	5.0151916	unchanging
5	AATK	0.4711421	0.5598642	unchanging
6	AB015752.4	-3.6808610	-3.5921390	unchanging

A first version plot

```
ggplot(genes) +
  aes(Condition1, Condition2 ) +
  geom_point()
```

```
table( genes$State)
```

down	unchanging	up
72	4997	127

Version 2 lets color by `State` so we can see the “up” and “down” significant genes compared to all the unchanging genes

```
ggplot(genes) +
  aes(Condition1, Condition2, col=State) +
  geom_point()
```

Version 3 plot, let's modify the default colors to our preferences

```
ggplot(genes) +
  aes(Condition1, Condition2, col=State) +
  geom_point() +
  scale_colour_manual( values=c("Red","Grey","yellow") ) +
  labs(x="Control (no drug)",
       y="Drug",
       title="Gene Expression Changes upon GLP-1 drug" ) +
  theme_bw()
```

## Gene Expression Changes upon GLP–1 drug

## Going Further

Let's have a look at the famous `gapminder` data set

```
# File location online
url <- "https://raw.githubusercontent.com/jennybc/gapminder/master/inst/extdata/gapminder.ts"

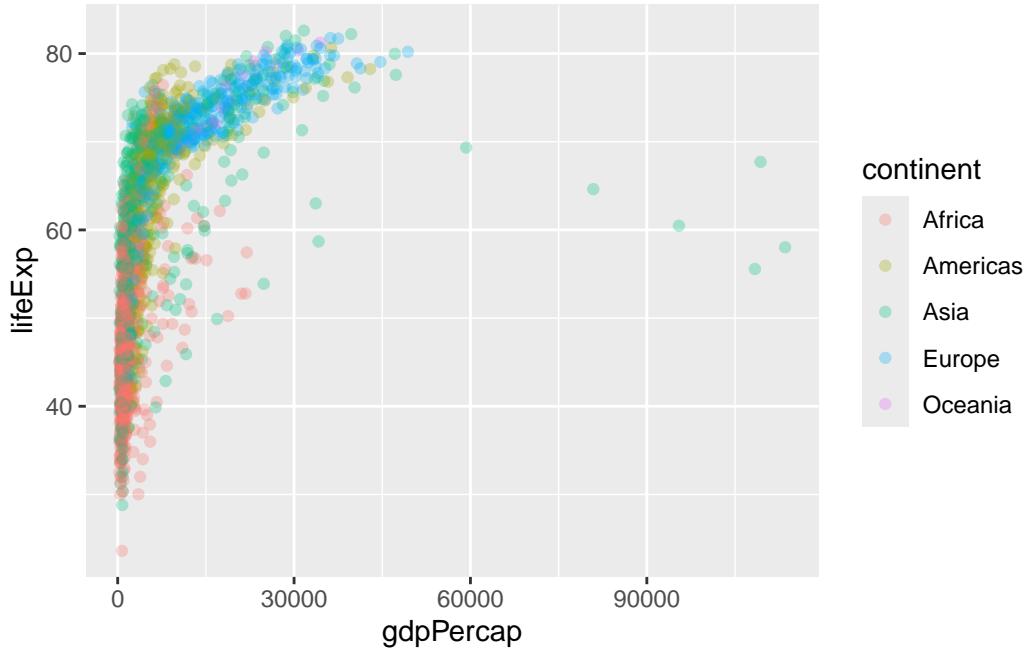

gapminder <- read.delim(url)
```

```
head(gapminder,3)
```

	country	continent	year	lifeExp	pop	gdpPerCap
1	Afghanistan	Asia	1952	28.801	8425333	779.4453
2	Afghanistan	Asia	1957	30.332	9240934	820.8530
3	Afghanistan	Asia	1962	31.997	10267083	853.1007

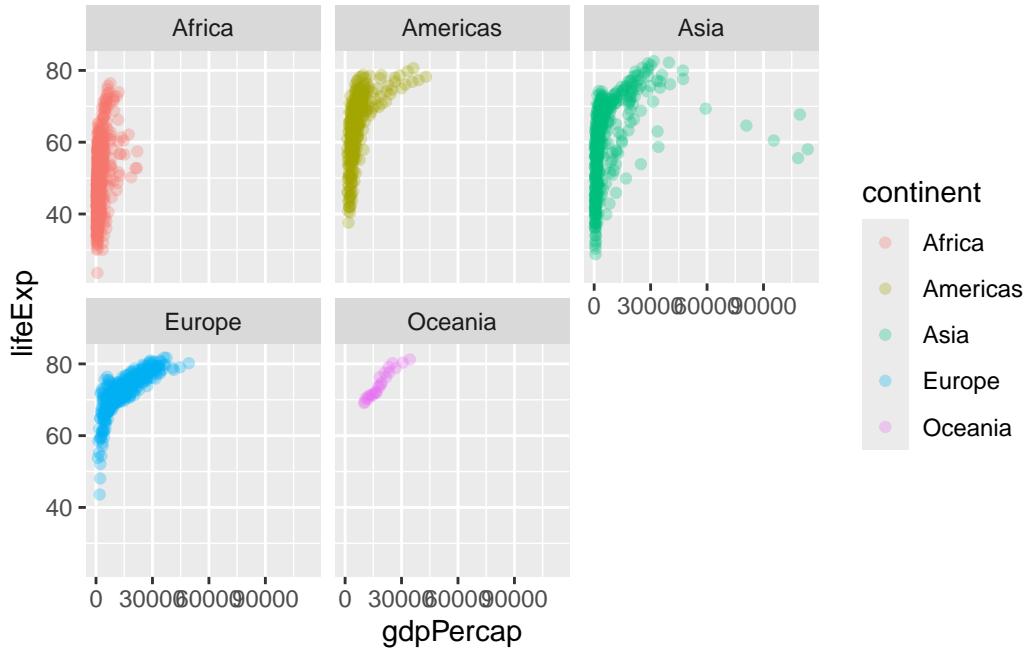

Version 1

```
ggplot(gapminder) +
  aes(gdpPerCap, lifeExp, col=continent) +
  geom_point(alpha=0.3,)
```

Let's "facet" (i.e. make a separate plot) by continent rather than the big hot mess

```
ggplot(gapminder)+  
  aes(gdpPercap, lifeExp, col=continent) +  
  geom_point(alpha=0.3,) +  
  facet_wrap(~continent)
```

## Custom Plot

How big is this gapminder dataset?

```
nrow(gapminder)
```

```
[1] 1704
```

```
ncol(gapminder)
```

```
[1] 6
```

I want to “filter” down to a subset of this data. I will use the **dplyr** package to help me.

First, I need to install it and load it up... `install.packages("dplyr")` and then `library(dplyr)`

```
library(dplyr)
```

```
Attaching package: 'dplyr'
```

```
The following objects are masked from 'package:stats':
```

```
filter, lag
```

```
The following objects are masked from 'package:base':
```

```
intersect, setdiff, setequal, union
```

```
gapminder_2007 <- filter(gapminder, year ==2007)  
head(gapminder_2007)
```

```
country continent year lifeExp      pop gdpPercap  
1 Afghanistan Asia 2007 43.828 31889923 974.5803  
2 Albania Europe 2007 76.423 3600523 5937.0295  
3 Algeria Africa 2007 72.301 33333216 6223.3675  
4 Angola Africa 2007 42.731 12420476 4797.2313  
5 Argentina Americas 2007 75.320 40301927 12779.3796  
6 Australia Oceania 2007 81.235 20434176 34435.3674
```

```
filter(gapminder_2007, country=="Ireland")
```

```
country continent year lifeExp      pop gdpPercap  
1 Ireland Europe 2007 78.885 4109086 40676
```

```
filter(gapminder, year==2007, country=="Ireland")
```

```
country continent year lifeExp      pop gdpPercap  
1 Ireland Europe 2007 78.885 4109086 40676
```

```
filter(gapminder, year==1977, country=="United States")
```

```
country continent year lifeExp      pop gdpPercap  
1 United States Americas 1977 73.38 220239000 24072.63
```

Q. make a plot comparing 1977 and 2007 for all countries

```

plotss <- filter(gapminder, year %in% c(1977,2007))
ggplot(plotss) +
  aes(gdpPercap, lifeExp, col=continent) +
  geom_point() +
  facet_wrap(~year)

```
